36 页 Q18; P81 Q20;

39 页 Q24;

54 页 Q37(b)(d)(f)(g)(h)(i)(m)

Q15

The third `for` loop is entered n^3 times. So, the total number of multiplications is n^3 .

Q16

The third `for` loop is entered mpn times and the number of multiplications is mpn .

Q18

The first minmax function makes zero comparisons when $n < 1$ and $2(n - 1)$ comparisons when $n \geq 1$.

The second function also makes zero comparisons when $n < 1$. However, when $n \geq 1$, the best case number of comparisons is $n - 1$ and the worst case number is $2(n - 1)$. The second function is expected to run faster on average.

Q20

The best case is one and the worst $n + 1$. In comparing the two codes, we see that the new code has an additional assignment $a[n] = x$. However, the `for` loop is simplified and does not include the check $i < n$. In a successful search, the tradeoff is between one assignment and between 1 and n comparisons of type $i < n$. In an unsuccessful search, the tradeoff is between 1 assignment and an additional comparison between elements of type T and $n + 1$ comparisons of the `for` $i < n$. For most data types T , we expect the new code to run faster than the old one.

Q24

$$(a) \quad t(n) = \begin{cases} 1, & n < 1 \\ 1 + t(n-1), & n \geq 1 \end{cases} \quad \text{so, } t(n) = 1 + t(n-1) = 2 + t(n-2) = \dots = n$$

$$(b) \quad 4 + O(n) = O(n)$$

$$(c) \quad 3 + O(n) = O(n)$$

Q37

| else r[j]++; | 1 | $\Omega(0), O(n^2)$ | $\Omega(0), O(n^2)$ | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| } | 0 | 0 | $\Theta(0)$ | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

所以算法的时间复杂度为 $\Theta(n^3)$

$\min_{i < l \leq j} \{ c(i, l-1) + c(l, j) \}$ 的执行时间为 $O(j-i) = O(m)$ ；内层 for-循环的执行时间为

$O(m(n-m))$ ；总的执行时间 $t(n) = O(\sum_{m=2}^n m(n-m)) = O(n^3)$

Q.27

```
void sort ( int E[ ], int n)
{ //对数组E中的n个元素进行排序
  if (n > 1) {
    i = n/2;
    j = n-i;
    令A 包含E中的前i 个元素
    令B 包含E中余下的j 个元素
    sort (A , i) ;
    sort (B , j) ;
    merge (A, B, E, i, j) ; //把A和B合并到E
  }
}
```

其中merge (A, B, E, i, j)的时间复杂度是 $O(i+j)$

$$\text{答: } t(n) = \begin{cases} d & n \leq 1 \\ t(\lfloor n/2 \rfloor) + t(\lceil n/2 \rceil) + cn & n > 1 \end{cases}$$

令 $n=2^m$, 则

$$t(n) = 2t(n/2) + cn = 2[2t(n/2^2) + c(n/2)] + cn = 2^2t(n/2^2) + 2cn$$

$$= \dots = 2^m t(n/2^m) + mcn = nd + cn \log_2 n$$

所以 $t(n) = \Theta(n \log_2 n)$

1.

$$T(N) \leq \begin{cases} 0 & \text{if } N=1 \\ \underbrace{T(\lceil N/2 \rceil)}_{\text{solve left half}} + \underbrace{T(\lfloor N/2 \rfloor)}_{\text{solve right half}} + \underbrace{cN}_{\text{combine}} & \text{otherwise} \end{cases}$$

$$\Rightarrow T(N) \leq cN \lceil \log_2 N \rceil$$

Proof by induction on N.

- Base case: $N = 1$.
- Define $n_1 = \lfloor n/2 \rfloor$, $n_2 = \lceil n/2 \rceil$.
- Induction step: assume true for $1, 2, \dots, N-1$.

$$\begin{aligned} T(N) &\leq T(n_1) + T(n_2) + cn \\ &\leq cn_1 \lceil \log_2 n_1 \rceil + cn_2 \lceil \log_2 n_2 \rceil + cn \\ &\leq cn_1 \lceil \log_2 n_2 \rceil + cn_2 \lceil \log_2 n_2 \rceil + cn \\ &= cn \lceil \log_2 n_2 \rceil + cn \\ &\leq cn(\lceil \log_2 n \rceil - 1) + cn \\ &= cn \lceil \log_2 n \rceil \end{aligned}$$

$$\begin{aligned} n_2 &= \lceil n/2 \rceil \\ &\leq \lceil 2^{\lceil \log_2 n \rceil / 2} \rceil \\ &\Rightarrow \log_2 n_2 \leq \lceil \log_2 n \rceil - 1 \end{aligned}$$

7

2. Case 1: $\log_b a = 1$, $n^{\log_b a}$ 是 $n^{1/2}$ 的上界 (例如 ϵ 取 $1/3$)。所以 $T(n) = \Theta(n)$ 。

3. $\Theta(n^2)$

4. $\Theta(n \log n)$

5. (a) Case 1: $\Theta(n^{\log_{10}})$

(b) Case 3: $\Theta(n^5)$

(c) Case 2: $\Theta(n^3 \log n)$

(d) Case 2 : $\Theta(n^3 \log^3 n)$

(e) case 3: $a=9, b=2, f(n)=n^2 2^n$, 任取 c

$$t(n) = \Theta(n^2 2^n)$$

(f) case 3: $a=3, b=8, f(n)=n^2 2^n \log n$, 任取 c

$$t(n) = \Theta(n^2 2^n \log n)$$

(g) case 1: $a=128, b=2, f(n)=6n$

$$t(n) = \Theta(n^7)$$

(h) case 3, $\log_b a = 7, f(n) = n^8 = \Omega(n^{7+\epsilon})$,

$$8(n/2)^8 < cn^8, t(n) = \Theta(n^8)$$

(i) case 3, $t(n) = \Theta(2^n/n)$

(j) case 1, $t(n) = \Theta(n^7)$

6. 练习14(a)

解: 因每次将较大的段进栈, 留下较小的段继续分划, 所以, 至多 $\lceil \log_2 n \rceil$ 次分划留下的段

长度为1, 所以进栈的段至多 $\lceil \log_2 n \rceil$ 。

7. 分析当 r 取3时是否能在 $O(n)$ 时间内求解选择问题? 分析 $r=7$ 时选择算法的时间复杂度。

解：当 $r=3$ 时，找不到满足 $\alpha + 1/3 < 1$ 的正数 α 使得 $n - 2 * \lceil (1/2)(n/3) \rceil < \alpha n$ ， $\lceil \cdot \rceil$ 表示向上取整。
所以不能确定是否能在 $O(n)$ 时间内用本节介绍的分治法求解。

当 $r=7$ 时，可证明： $T(n) \leq T(n/7) + T(5n/6) + cn$ ，当 $n > 1$ 时成立。用归纳法可证明：
 $T(n) \leq 42cn$ 成立。
